NIC26

From management to orchestration

Why modernize now?

- More platforms, identities and ownership models
- Security decisions must happen faster
- Manual operations do not scale
- Users expect consumer-grade onboarding and recovery

The modern Intune operating model

- Cloud-native by default
- Identity and device posture together
- One lifecycle from enrollment to retirement

Operating loop

Enroll and configure

Protect and verify

Observe and improve

Recover or offboard

Streamlined enrollment

NIC26

Enrollment principles for 2026

- Standardize the experience, not every platform detail
- Minimize pre-provisioning and technician touch
- Separate device preparation from user personalization
- Design for reset, replacement and recovery from day one

Windows onboarding with Autopilot

- Target a predictable first sign-in
- Keep required apps and policies intentional
- Measure failures instead of adding more waiting

NIC26

One strategy, four platforms

- Windows: Autopilot and cloud-native join
- macOS: Automated Device Enrollment
- iOS/iPadOS: Automated Device Enrollment
- Android: Enterprise enrollment modes

+ Linux…

Demo – Enrollment Time Grouping

A faster onboarding experience, without losing control

Robust endpoint security

NIC26

Security starts with a clean baseline

- Define a small set of non-negotiable controls
- Use security baselines as a starting point, not the finish line
- Connect compliance signals to access decisions
- Plan exceptions with owners and expiration dates

Security across the device estate

- **Windows**
  hardening, updates and endpoint protection
- **Apple**
  platform controls and managed applications
- **Mobiles**
  Mobile Application Managment vs Mobile Device Management

Need a starting point?

Demo – is a Sync a Sync?

Investigate, remediate and prove the outcome

NIC26

AI-driven insights and automation

NIC26

Where AI adds real value

- Summarize large volumes of operational signals
- Translate intent into an initial configuration proposal
- Guide remediation while keeping accountability with admins

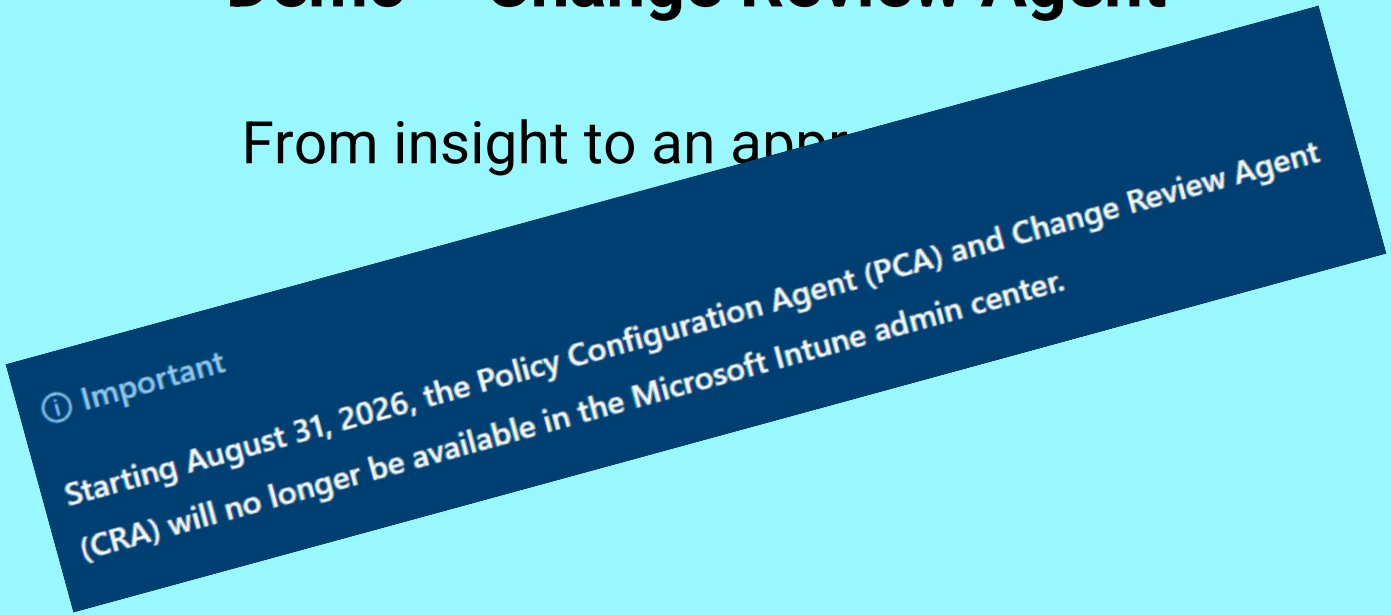

Copilot in the admin workflow

- Ask better questions about the environment
- Accelerate investigation and documentation
- Turn findings into repeatable actions

2026 and beyond

Compliance becomes an access-control signal

FASTER COMPLIANCE

Security state changes

Firewall, antivirus, BitLocker, Defender, Secure Boot and OS build can affect compliance.

Immediate reevaluation

The Windows client detects relevant changes and triggers a sync instead of only waiting for check-in.

Conditional Access

The updated compliance state can feed access decisions sooner.

Windows 11 26H2: an enablement moment

WINDOWS 11 26H2

Shared foundation

26H2 shares the servicing foundation with Windows 11 24H2 and 25H2.

Small update

Eligible devices move through an enablement package, normally with one restart.

Lifecycle reset

The annual release enables selected capabilities and starts a new support lifecycle.

NIC26

Windows Settings Backup: recovery by design

26H2 DEFAULT CHANGE

Backup enabled

Windows Settings Backup is enabled by default on eligible commercial devices unless explicitly configured.

Policy still wins

Existing administrator-configured enable or disable policies continue to be honored.

Replacement experience

Supported settings and Microsoft Store app lists can help with device recovery and replacement.

Unattended Remote Help: support without a user

DEMO

No user present

Authorized helpers can troubleshoot a device through an unattended control session.

Tight guardrails

Use dedicated RBAC permissions, narrow device scope and Conditional Access for helpers.

Broader entitlement

Remote Help is included with eligible Microsoft 365 E3 and higher enterprise plans.

NIC26

Device properties catalog: inventory becomes a signal

DEMO

Hardware & posture

BIOS, TPM, encryption, battery and network properties.

Application signals

Collect application-related signals and selected registry data.

Query & action

Use collected properties for investigation, lifecycle and remediation.

App information: from package to service

RECENT RELEASES

Richer context

Show purpose, ownership and deployment relevance around an app.

Faster delivery

Win32 app changes use push notifications and IME checks after ESP.

Operational view

Connect app state, installation signals and troubleshooting decisions.

NIC26

Deployment plans: controlled rollout by design

PUBLIC PREVIEW

Reusable plan

Define standardized rings, groups, filters and global exclusions.

Timed progression

Control deferral days and hours between rollout rings.

Safer change

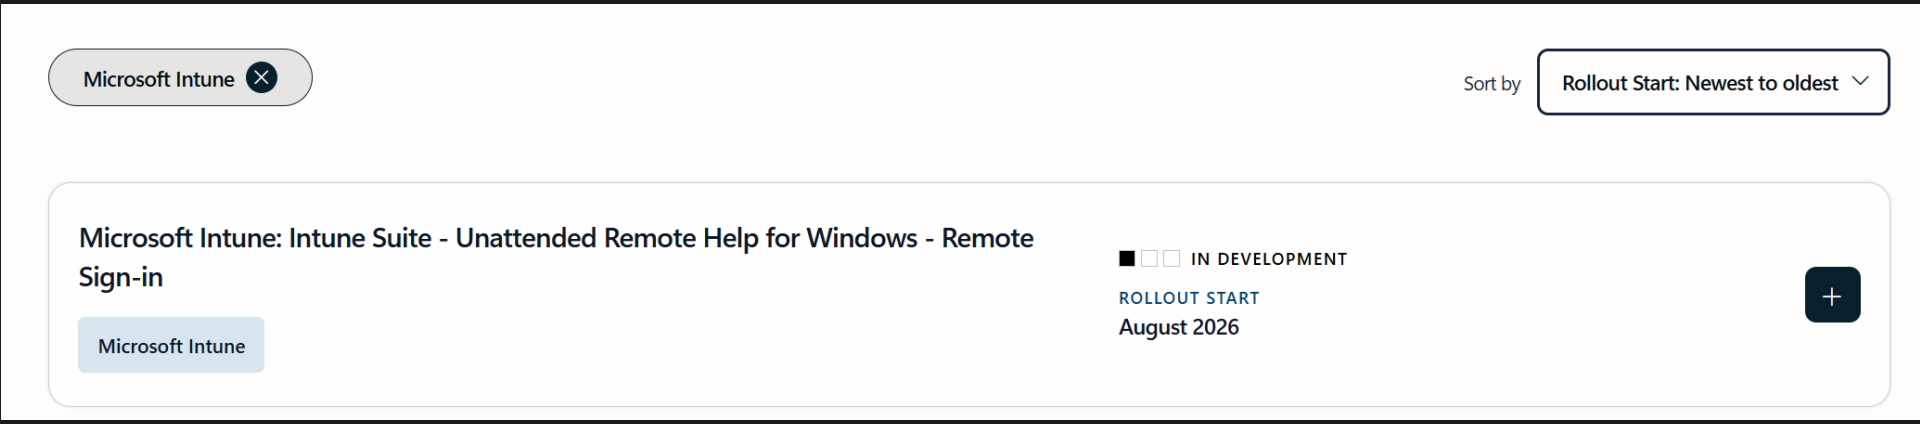

Stage apps or policies and combine rollout with approval controls.
